'cabernet Sauvignon' Clone 8 dissected buds. Samples were collected May 13. 2002 from pre-bloom plants (10-11 days before bloom), pre-veraison. Sampled vines were located budiversity of California, Davis, Experimental Vineyard. cDNAs were made by oligo-dT priming and directionally cloned. 5' and 3' adaptors were used in cloning as follows: S'-AATCTGGAGGGGGGGGCGAGTGTTACGGCGGGG-T(30)NN-3'. Library was constructed using the Clontech Creator SMART kit and size-selected to contain the 0.5-3 kb size fraction."

//note="Vector: pBluescript II SK (+) XR; Site 1: SstI (5')
end of cDNA); Site 2: XhoI (3' end of cDNA); Toung and
mature leaves, along with green stems, from 8 year old
trees harvested within the Boise Cascade region of
Washington state on May 15th, 2001. mRNA was isolated from
each tissue source independently and equal quantities of
mRNA from ach tissue were then pooled cDNA was prepared
from 20 micrograms of mRNA according to the full-length
cDNA library construction method described by Carninci P
et al. (2000), Genome Research 10(10):1617-1630 and
directionally ligated into the pBluescript II SK (+) XR
vector digested with SstI (5' end) and XhoI (3'). Plasmid
DNA was then transformed by electroporation into DH10B
cells (Invitrogen) for propagation."

/note="Vector: pSPORT1, Site_1: SalI, Site_2: NotI, Total

RNA was isolated from mycelium of P. infestans DDR7602

cultured for 4 weeks in synthetic medium. BST clones were named by their position in the microtiter plate, preceded by the prefix MY (for mycelial) and the successive number of the microtiter plate (e.g. MY-06-A-04)."
                                                                                                                                                                                                                                                                     BE776235 580 bp mRNA linear EST 20-SEP-2000 MY-12-P-04 PinfestansMY Phytophthora infestans cDNA, mRNA sequence.

This sequence is from a Xenopus Gene Collection (XGC) library
constructed by Aaron M. Zorn.
CDNA was oligo dT primed from 5ug of poly A+ RNA from stages 10-13
gastrulae. EcoRI-NotI cut cDNA was then ligated into pCS107 with
CEORI at the 5' end and NotI at the 3' end.
Vector: pCS107; Site 1: EcoRI; Site_2: NotI

Clones are derived from the chimpanzee BAC library RPCI-43 This BAC end was generated during the R&D process and may have higher chance of clone tracking errors.
Clones are derived from the bovine BAC library CHORI-240 (http://www.chori.org/bacpac/bovine240.htm). For BAC library availability, please contact Pieter de Jong (pdejong@mail.cho.org). Clones may be purchased from BACPAC Resources (http://www.chori.org/bacpac/ordering_information.htm). This work was undertaken as part of the International Bovine BAC Mapping Consortium (IBBMC) by CSIRO Livestock Industries, Australia and the British Columbia Genome Sciences Centre, Canada. Patral T7 Class: BAC ends.

XhoI; This library was constructed by Keliang Tang, Robert Cole, and L. David Sibley at Washington University. cDNAs were synthesized from poly(A) + RNA by olidod(T) priming, size-selected and directionally cloned into the Uni-ZAP XR lambda vector (Stratagene). The primary library was mass exclused as phagemids and rescued in Solk cells. The plasmid library was recovered from the Solk cells and transformed in mass into DH108 (GeneHog, Research Genetics, Inc.) for sequencing, WARNING: This library may contain a small percentage contaminants from human

/note="Vector: pUCIB; Site_1: Smal; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTAL 10:1) was mechanically sheared to give a tight size distribution (approx 2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."
10.1 sheared DNA library

Clones are derived from the Trypanosoma brucei GUTat 10.1 sheared
DNA library constructed at TIGR. Clones will be available for
distribution through ATCC. Sheared DNA end sequences search page:

//note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2:
Xhol; Construction of the cDNA library was carried out
using Stratagenes 'UnizAP - cDNA synthesis kit'.
constructed using an oligo dT primer/linker that contains
a Xhol site within it. Pollowing ds cDNA synthesis,
EcoRI adapters were ligated to the blunt ends and sample
was digested with Xhol. The result is cDNA with an EcoRI
sticky end on one side and a Xhol sitcky end on the other.
This cDNA was ligated dontaining the pBluescript sequence as
vector is designed containing the pBluescript sequence as
well as lambda DNA and cDNA is cloned within this
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Email: est@watson.wustl.edu
Libraries were constructed by Dr. Stavros Bashiardes as part of the
Physocomitrella EST program (PEP) at the Univ. of Leeds (UK) and
Washington Univ. in St. Louis (USA) DNA sequencing by: Washington
University Genome Sequencing Center For information on obtaining a
clone please contact: Celia Knight (c.d.knight@leeds.ac.uk)
Seq primer: -40RP from Gibco
High quality sequence stopp: 416.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BZ130571 582.bp DNA linear GSS 11-OCT-2002 CH230-39416.TJ CHORI-230 Segment 2 Rattus norvegicus genomic clone CH230-39416, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exassist as a helper plage that releases the pBluescript sequence and circularises it as single stranded plasmids that are then packaged (by helper phage) and secreted out of the host cell as plagemids. SOLR cells were transformed with phagemids and the library was plated out on LB-amp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plates to select for transformants. Approximately 1,000,000 colonies were grown and recovered. The double stranded plasmid library was recovered by using Quiagen Midi prep kit. 2 micro grams of each library were used to transform DH10B cells by electroporation."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pBluescript sequence. The vector was then packaged using edd gigapackaging extracts. Library was grown in XIIBlue MRF' cells and amplified. The library was excised by mass excision using Stratagens 'Mass excision kit' that uses

The library was constructed by Claire Murphy and Dr. James McCarter
at Washington University, St. Louis. Oligo(dr)-SL2 PCR based
library. cDNA PCR products of size >4100 nucleotides containing SL2
on the 5' end and oligo(dr) on the 3' end were non-directionally
cloned into pCRII-TOPO(Invitrogen) following the Topo TA cloning
protocol. Intestine RNA was provided by Dr. Douglas Jasmer of
Washington State University (djasmer@vetmed.wsu.edu).
Seq primer: SL1 primer
High quality sequence stop: 525.
